

Test report

303263-1R1TRFWL

Date of issue: October 7, 2016

Applicant:

Intracom S.A. Telecom Solutions

Product:

60 GHz PtP Small cell radio

Model:

StreetNode 6250 PtP

Part number:

SN6250-F-2-L-G-AC

Part number variant:

SN6250-F-2-H-G-DC

FCC ID:

2AHZC-SN6250BF02TA

Specification:

FCC 47 CFR Part 15 Subpart C, §15.255

Operation within the band 57–64 GHz.

Test location

1.2 Test specifications

FCC 47 CFR Part 15, Subpart C, Clause 15.255	Operation within the band 57–64 GHz
--	-------------------------------------

1.3 Test methods

ANSI C63.10 v 2013	American National Standard for Procedures for Compliance Testing of Unsilenced Wireless Devices
--------------------	---

1.4 Statement of compliance

In the configuration tested, the EUT was found compliant.

Testing was completed against all relevant requirements of the test standard. Results obtained indicate that the product under test complies in full with the requirements tested. The test results relate only to the items tested.

See “Summary of test results” for full details.

1.5 Exclusions

None

§15.255(c)	Limits on spurious emissions	Pass
§15.255(e)(1)	6 dB BW	Pass
§15.255(f)	Frequency stability	Pass

Notes: ¹ The EUT is a professionally installed device and the installer is responsible for ensuring that the proper antenna is employed.

Section 3. Equipment under test (EUT) details

3.1 Sample information

Receipt date	March 29, 2016
Nemko sample ID number	1, 2

3.2 EUT information

Product name	60 GHz PtP Small cell radio
Model	StreetNode 6250 PtP
Part number	SN6250-F-2-L-G-AC
Part number variant*	SN6250-F-2-H-G-DC
Serial number	311602000130 (Low radio) and 311602000133 (High radio)

* - Part number variants: **SN6250-F-2**-u-z-vv: u: **L** (Low radio), **H** (High radio); z: **G** (Grey), **C** (Charcoal Gray); vv: (Supply voltage) **AC** or **DC**

3.3 Technical information

Frequency band	57–64 GHz
Frequency Min	58.275 GHz (Low radio), 61.775 GHz (High radio)
Frequency Max	59.275 GHz (Low radio), 62.775 GHz (High radio)
Channel BW	250 MHz
Type of modulation	4-QAM, 16-QAM, 32-QAM, 64-QAM and 128-QAM
Emission classification (F1D, G1D, D1D)	W7D
Power requirements	AC: 90–240 V _{AC} 50/60 Hz or DC: –40.5 to –60 V _{DC}
Antenna information	Internal proprietary antenna with 34 dBi gain The EUT is professionally installed.

3.4 Product description and theory of operation

StreetNode 6250 PTP is an innovative compact all-outdoor native packet radio operating in the 57–64 GHz band (V-Band). It can be used to implement highly-flexible Point-to-Point Microwave (PtP MW) backhaul topologies, reaching challenging small-cell locations and delivering best-in-class connectivity at street level. StreetNode™ 6250 PTP satisfies every critical aspect of 3G and 4G/LTE/LTE-A small-cell backhaul, providing high capacity, low latency, automated provisioning and high availability, while optimizing the small-cell business case economics.

3.5 EUT exercise details

EUT was controlled from PC using Windows Terminal to set the transmission on desired channel and modulation type.

3.6 EUT setup diagram

Figure 3.6-1: Setup diagram

Section 4. Engineering considerations

4.1 Modifications incorporated in the EUT

There were no modifications performed to the EUT during this assessment.

4.2 Technical judgment

None

4.3 Deviations from laboratory tests procedures

No deviations were made from laboratory procedures.

Section 5. Test conditions

5.1 Atmospheric conditions

Temperature	15–30 °C
Relative humidity	20–75 %
Air pressure	860–1060 mbar

When it is impracticable to carry out tests under these conditions, a note to this effect stating the ambient temperature and relative humidity during the tests shall be recorded and stated.

5.2 Power supply range

The normal test voltage for equipment to be connected to the mains shall be the nominal mains voltage. For the purpose of the present document, the nominal voltage shall be the declared voltage, or any of the declared voltages $\pm 5\%$, for which the equipment was designed.

Section 6. Measurement uncertainty

6.1 Uncertainty of measurement

Measurement uncertainty budgets for the tests are detailed below. Measurement uncertainty calculations assume a coverage factor of $K = 2$ with 95% certainty.

Test name	Measurement uncertainty, dB
All antenna port measurements	0.55
Conducted spurious emissions	1.13
Radiated spurious emissions	3.78
AC power line conducted emissions	3.55

Section 7. Test equipment

Note: NCR - no calibration required, VOU - verify on use

Section 8. Testing data

8.1 FCC 15.207(a) AC power line conducted emissions limits

8.1.1 Definitions and limits

Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table, as measured using a 50 μ H/50 Ω line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Table 8.1-1: Conducted emissions limit

Frequency of emission, MHz	Conducted limit, dB μ V	
	Quasi-peak	Average**
0.15–0.5	66 to 56*	56 to 46*
0.5–5	56	46
5–30	60	50

Note: * - The level decreases linearly with the logarithm of the frequency.

** - A linear average detector is required.

8.1.2 Test summary

Test date	April 5, 2016	Temperature	22 °C
Test engineer	Andrey Adelberg	Air pressure	1010 mbar
Verdict	Pass	Relative humidity	32 %

8.1.3 Observations, settings and special notes

The EUT was set up as tabletop configuration.

The spectral scan has been corrected with transducer factors (i.e. cable loss, LISN factors, and attenuators) for determination of compliance.

A preview measurement was generated with the receiver in continuous scan mode. Emissions detected within 6 dB or above limit were re-measured with the appropriate detector against the correlating limit and recorded as the final measurement.

Receiver settings for preview measurements:

Resolution bandwidth	9 kHz
Video bandwidth	30 kHz
Detector mode	Peak and Average
Trace mode	Max Hold
Measurement time	1000 ms

Receiver settings for final measurements:

Resolution bandwidth	9 kHz
Video bandwidth	30 kHz
Detector mode	Quasi-Peak and Average
Trace mode	Max Hold
Measurement time	1000 ms

8.1.4 Test data

Plot 8.1-1: Conducted emissions on phase line

Plot 8.1-2: Conducted emissions on neutral line

8.2 FCC 15.255(b) and (e) Conducted output power and EIRP requirements

8.2.1 Definitions and limits

(b) Within the 57–64 GHz band, emission levels shall not exceed the following equivalent isotropically radiated power (EIRP):

(1) Products other than fixed field disturbance sensors shall comply with one of the following emission limits, as measured during the transmit interval:

(i) Except as indicated in paragraph (b)(1)(ii) of this section, the average power of any emission shall not exceed 40 dBm and the peak power of any emission shall not exceed 43 dBm.

(ii) For transmitters located outdoors, the average power of any emission shall not exceed 82 dBm minus 2 dB for every dB that the antenna gain is less than 51 dBi. The peak power of any emission shall not exceed 85 dBm minus 2 dB for every dB that the antenna gain is less than 51 dBi. The provisions of §15.204(c)(2) and (c)(4) of this part that permit the use of different antennas of the same type and of equal or less directional gain do not apply to intentional radiator systems operating under this provision. In lieu thereof, intentional radiator systems shall be certified using the specific antenna(s) with which the system will be marketed and operated. Compliance testing shall be performed using the highest gain and the lowest gain antennas for which certification is sought and with the intentional radiator operated at its maximum available output power level. The responsible party, as defined in §2.909 of this chapter, shall supply a list of acceptable antennas with the application for certification.

(4) The peak power shall be measured with an RF detector that has a detection bandwidth that encompasses the 57–64 GHz band and has a video bandwidth of at least 10 MHz. The average emission levels shall be calculated based on the measured peak levels, over the actual time period during which transmission occurs. Measurement procedures that have been found to be acceptable to the Commission in accordance with §2.947 of this chapter may be used to demonstrate compliance.

(e) Except as specified paragraph (e)(1) of this section, the peak transmitter conducted output power shall not exceed 500 mW. Depending on the gain of the antenna, it may be necessary to operate the intentional radiator using a lower peak transmitter output power in order to comply with the EIRP limits specified in paragraph (b) of this section.

(1) Transmitters with an emission bandwidth of less than 100 MHz must limit their peak transmitter conducted output power to the product of 500 mW times their emission bandwidth divided by 100 MHz. For the purposes of this paragraph, emission bandwidth is defined as the instantaneous frequency range occupied by a steady state radiated signal with modulation, outside which the radiated power spectral density never exceeds 6 dB below the maximum radiated power spectral density in the band, as measured with a 100 kHz resolution bandwidth spectrum analyzer. The center frequency must be stationary during the measurement interval, even if not stationary during normal operation (e.g., for frequency hopping devices).

(2) Peak transmitter conducted output power shall be measured with an RF detector that has a detection bandwidth that encompasses the 57–64 GHz band and that has a video bandwidth of at least 10 MHz. Measurement procedures that have been found to be acceptable to the Commission in accordance with §2.947 of this chapter may be used to demonstrate compliance.

(3) For purposes of demonstrating compliance with this paragraph, corrections to the transmitter conducted output power may be made due to the antenna and circuit loss.

8.2.2 Test summary

Test date	March 31, 2016	Temperature	22 °C
Test engineer	Andrey Adelberg	Air pressure	1005 mbar
Verdict	Pass	Relative humidity	32 %

8.2.3 Observations, settings and special notes

EUT is an outdoor device with an emission bandwidth of more than 100 MHz. Average EIRP limit was calculated as follows: $82 \text{ dBm} - 2 \times (51 \text{ dBi} - 34 \text{ dBi}) = 48 \text{ dBm}$.

8.3 FCC 15.255(c) Limits on spurious emissions

8.3.1 Definitions and limits

- (1) The power density of any emissions outside the 57–64 GHz band shall consist solely of spurious emissions.
- (2) Radiated emissions below 40 GHz shall not exceed the general limits in §15.209.
- (3) Between 40 GHz and 200 GHz, the level of these emissions shall not exceed 90 pW/cm² (85.3 dBμV/m) at a distance of 3 meters.
- (4) The levels of the spurious emissions shall not exceed the level of the fundamental emission.
- (d) Only spurious emissions and transmissions related to a publicly-accessible coordination channel, whose purpose is to coordinate operation between diverse transmitters with a view towards reducing the probability of interference throughout the 57–64 GHz band, are permitted in the 57–57.05 GHz band.

Table 8.3-1: FCC §15.209 – Radiated emission limits

Frequency, MHz	Field strength of emissions		Measurement distance, m
	μV/m	dBμV/m	
30–88	100	40.0	3
88–216	150	43.5	3
216–960	200	46.0	3
above 960	500	54.0	3

Notes: In the emission table above, the tighter limit applies at the band edges.

For frequencies above 1 GHz the limit on peak RF emissions is 20 dB above the maximum permitted average emission limit applicable to the equipment under test

Table 8.3-2: FCC restricted frequency bands

MHz	MHz	MHz	GHz
0.090–0.110	16.42–16.423	399.9–410	4.5–5.15

8.3.2 Test summary

Test date	March 29, 2016	Temperature	21 °C
Test engineer	Andrey Adelberg	Air pressure	1008 mbar
Verdict	Pass	Relative humidity	32 %

8.3.3 Observations, settings and special notes

The spectrum was searched from 30 MHz to the 220 GHz.
Radiated measurements were performed at a distance of 3 m for frequencies below 40 GHz and 30 cm for frequencies above 40 GHz.
Limit line calculation for frequencies above 40 GHz: $85.3 \text{ dB}\mu\text{V/m} + 20 \times \log(3/0.3) = 85.3 + 20 \text{ dB} = 105.3 \text{ dB}\mu\text{V/m}$

Spectrum analyser settings for radiated measurements within restricted bands below 1 GHz:

Resolution bandwidth	100 kHz
Video bandwidth	300 kHz
Detector mode	Peak
Trace mode	Max Hold

Spectrum analyser settings for peak radiated measurements within restricted bands above 1 GHz:

Resolution bandwidth	1 MHz
Video bandwidth	3 MHz
Detector mode	Peak
Trace mode	Max Hold

8.4 FCC 15.255(e)(1) 6 dB bandwidth

8.4.1 Definitions and limits

(e)(1) Transmitters with an emission bandwidth of less than 100 MHz must limit their peak transmitter conducted output power to the product of 500 mW times their emission bandwidth divided by 100 MHz. For the purposes of this paragraph, emission bandwidth is defined as the instantaneous frequency range occupied by a steady state radiated signal with modulation, outside which the radiated power spectral density never exceeds 6 dB below the maximum radiated power spectral density in the band, as measured with a 100 kHz resolution bandwidth spectrum analyzer. The center frequency must be stationary during the measurement interval, even if not stationary during normal operation (e.g., for frequency hopping devices).

8.4.2 Test summary

Test date:	April 1, 2016	Temperature:	22 °C
Test engineer:	Andrey Adelberg	Air pressure:	1008 mbar
Verdict:	Pass	Relative humidity:	32 %

8.4.3 Observations, settings and special notes

Spectrum analyser settings:

Resolution bandwidth	100 kHz
Video bandwidth	$\geq 3 \times \text{RBW}$
Frequency span	Wider than emission bandwidth
Detector mode	Peak

8.5 FCC 15.255(f) Frequency stability

8.5.1 Definitions and limits

Fundamental emissions must be contained within the frequency bands specified in this section during all conditions of operation. Equipment is presumed to operate over the temperature range -20 to + 50 degrees Celsius with an input voltage variation of 85% to 115% of rated input voltage, unless justification is presented to demonstrate otherwise.

8.5.2 Test summary

Test date	March 31, 2016	Temperature	22 °C
Test engineer	Andrey Adelberg	Air pressure	1008 mbar
Verdict	Pass	Relative humidity	31 %

8.5.3 Observations, settings and special notes

Low radio:

Lower channel band edge was calculated as follows: 58.275 GHz – half of declared (250 MHz) channel bandwidth.
Upper channel band edge was calculated as follows: 59.275 GHz + half of declared (250 MHz) channel bandwidth.

High radio:

Lower channel band edge was calculated as follows: 61.775 GHz – half of declared (250 MHz) channel bandwidth.
Upper channel band edge was calculated as follows: 62.775 GHz + half of declared (250 MHz) channel bandwidth.

8.5.4 Test data

Table 8.5-1: Frequency drift measurement for Low radio

Test conditions	Frequency, GHz	Drift, kHz
+50 °C, 120 V _{AC}	58.275028205	28.205
+40 °C, 120 V _{AC}	58.274909615	-90.385
+30 °C, 120 V _{AC}	58.274886859	-113.141
+20 °C, +15 % (132 V _{AC})	58.274904167	-95.833
+20 °C, 120 V _{AC}	58.274901282	-98.718
+20 °C, -15 % (108 V _{AC})	58.274905128	-94.872
+10 °C, 120 V _{AC}	58.274936218	-63.782
0 °C, 120 V _{AC}	58.275130449	130.449
-10 °C, 120 V _{AC}	58.274945353	-54.647
-20 °C, 120 V _{AC}	58.274794872	-205.128

Note: the drift was calculated as follows: Measured frequency – Declared frequency (58.275 GHz)

Table 8.5-2: Lower band edge drift calculation for Low radio

Lower channel band edge, GHz	Max negative drift, kHz	Drifted lower channel band edge, GHz	Lower band edge limit, GHz	Margin, GHz
58.150	205.128	58.1497949	57.000	1.150

Notes: Drifted lower channel band edge = Lower channel band edge – max negative drift.

Table 8.5-3: Upper band edge drift calculation for Low radio

Upper channel band edge, GHz	Max positive drift, kHz	Drifted upper channel band edge, GHz	Upper band edge limit, GHz	Margin, GHz
59.400	130.449	59.4001304	64.000	4.600

Notes: Drifted upper channel band edge = Upper channel band edge + max positive drift.

Table 8.5-4: Frequency drift measurement for High radio

Test conditions	Frequency, GHz	Drift, kHz
+50 °C, 48 V _{DC}	62.774833974	-166.026
+40 °C, 48 V _{DC}	62.774777885	-222.115
+30 °C, 48 V _{DC}	62.774787821	-212.179
+20 °C, +15 % (55.2 V _{AC})	62.774810256	-189.744
+20 °C, 48 V _{DC}	62.774814103	-185.897
+20 °C, -15 % (40.8 V _{AC})	62.774811218	-188.782
+10 °C, 48 V _{DC}	62.774952083	-47.917
0 °C, 48 V _{DC}	62.775040865	40.865
-10 °C, 48 V _{DC}	62.774996795	-3.205
-20 °C, 48 V _{DC}	62.774871795	-128.205

Note: the drift was calculated as follows: Measured frequency – Declared frequency (62.775 GHz)

Table 8.5-5: Lower band edge drift calculation for High radio

Lower channel band edge, GHz	Max negative drift, kHz	Drifted lower channel band edge, GHz	Lower band edge limit, GHz	Margin, GHz
61.650	222.115	61.6497779	57.000	4.650

Notes: Drifted lower channel band edge = Lower channel band edge – max negative drift.

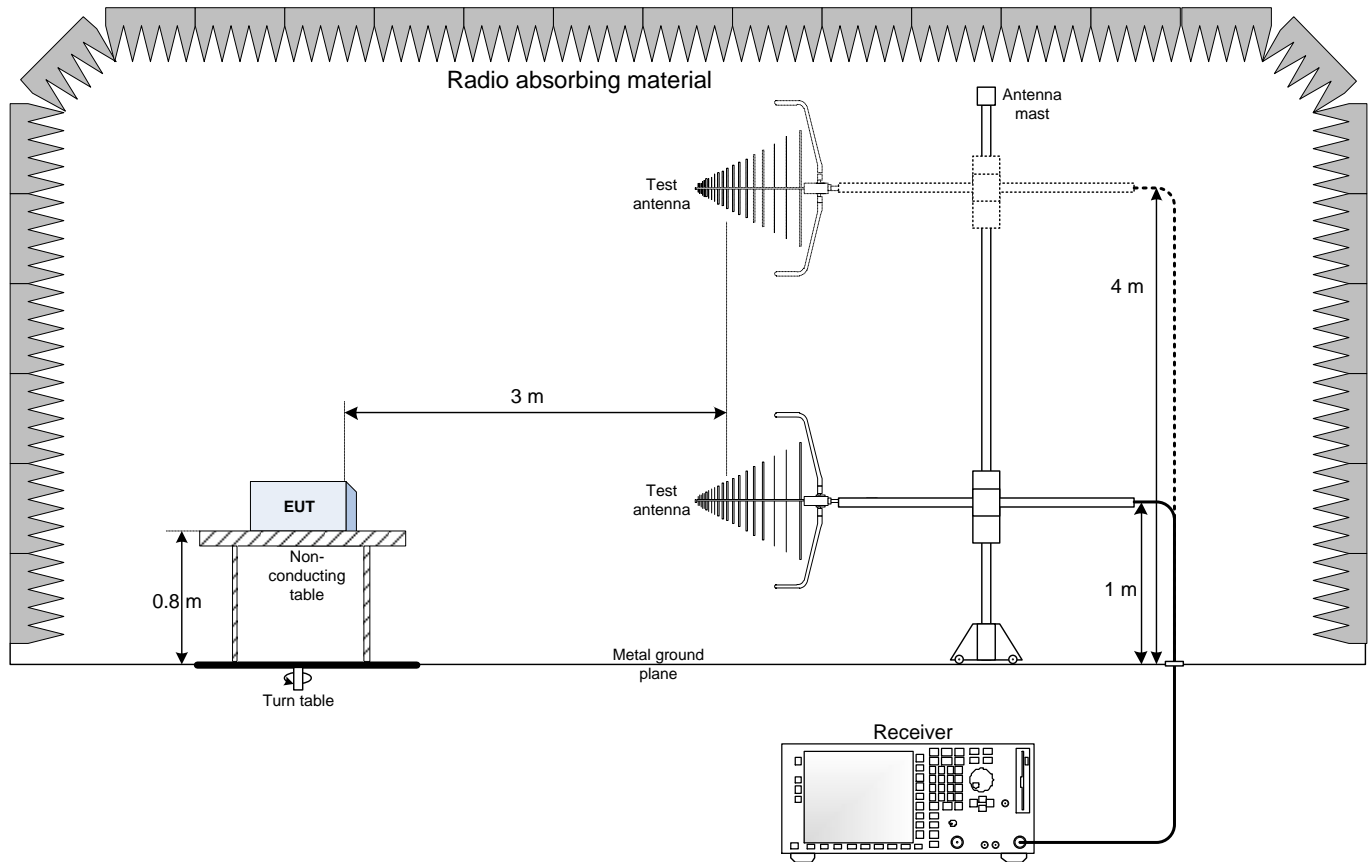

Table 8.5-6: Upper band edge drift calculation for High radio

Upper channel band edge, GHz	Max positive drift, kHz	Drifted upper channel band edge, GHz	Upper band edge limit, GHz	Margin, GHz
62.900	40.865	62.9000409	64.000	1.100

Notes: Drifted upper channel band edge = Upper channel band edge + max positive drift.

Section 9. Block diagrams of test set-ups

9.1 Radiated emissions set-up for frequencies below 1 GHz

9.2 Radiated emissions set-up for frequencies above 1 GHz

9.3 Conducted emissions set-up
